

TECHNICAL AND ENVIRONMENTAL DUE DILIGENCE

There are an ever increasing number of obstacles on the route to the successful development, implementation and operation of electricity generating projects. However, through early identification, these obstacles can often be easily avoided or mitigated.

Undertaking due diligence is repeatedly the most effective way of identifying these obstacles and the associated avoidance or mitigation measures.

In addition, effective due diligence will protect against risks and liabilities providing opportunities to beneficially contribute to the overall performance of electricity generating projects.

Our Capabilities

Whilst undertaking effective due diligence is often demanding, the WPA team are able to efficiently navigate time constraints, data limitations and complex legislation / requirements.

Using tried and tested methodology, the WPA team are able to tailor a specific approach based on the individual needs of a Client, and their project or projects, such that we clearly communicate advice which is technically sound and commercially robust.

WPA is able to provide expert services to investors, developers and governments, helping them to navigate the challenges associated with project development, implementation and operation often helping to de-risk decisions.

Project Development / Implementation

For environmental, planning and technical due diligence at the project development / implementation stage, WPA are able to establish the nature of risks that could impact on the future construction and operation of projects.

WPA are also able to establish the nature of any parameters associated with project consents or project permits, such that our Clients are able to understand any potential limitations of their project or projects.

Following the identification of any risks and parameters, WPA are able to identify the probability that they would materialise and their costs and / or implications to the programme (wherever relevant / practical).

Project Operation

For environmental and planning due diligence at the project operation stage, WPA are able to verify ongoing compliance with current legislation and guidance.

In addition, to safeguard future compliance, WPA are able to undertake an assessment of potential future legislative / guidance requirements would also be made.

For technical due diligence, WPA are able to assess any potential efficiency improvements and cost reductions.
